WORK EXPERIENCE

Justworks **New York, NY**

Salesforce Developer *Nov 2026 – Present*

- Develop and maintain Apex, Lightning Web Components, and Flow automation supporting Revenue team processes, from deal close through billing.
- Build and support integrations between Salesforce and external billing and finance systems using REST APIs, with a focus on data integrity and reliable syncing.
- Partner with Revenue and Business Operations stakeholders to turn requirements into scalable Salesforce solutions, delivered through Git-based source control and peer-reviewed deployments.

NYC Office of Technology and Innovation (OTI) **New York, NY**

Salesforce Developer/Administrator *Jun 2024 – Sep 2026*

- Built a reusable Apex client library for Google BigQuery to sync 1M+ records into Salesforce with no loss or duplication, using paginated pulls, Batch and Queueable Apex, external-ID upserts, error logging with retry, and count reconciliation.
- Integrated an external vulnerability system into Salesforce via Platform Events and an OAuth 2.0 client-credentials Connected App, auto-creating cases from CVE feeds published over REST.
- Developed an Apex REST webhook endpoint linking GitHub pull requests to Salesforce project tasks, replacing manual copy-paste tracking of PR links and titles and eliminating a recurring source of stale or missing work records.

Olympix **New York, NY**

Software Engineering Intern *Sep 2024 – May 2025*

- Designed a multi-agent AI pipeline (ideation, exploitation, output-parsing, and failure-feedback agents) with a status-driven orchestration loop that generated exploits and verified them by execution.
- Ported the system from Python into the company's C# codebase, learning C# on the job and building a reusable agent template so new agents could be added by defining their role.
- Built a Forge-based harness validating generated exploits at runtime against a corpus of 20–30 Solidity contracts, independently reproducing a documented exploit responsible for a $10K loss and confirming it against a published PoC.

PROJECTS

Vulnerability Management Case Automation — NYC OTI *Jul 2025 – Aug 2026*

- Eliminated ~15 hours/week of manual PDF generation and agency notification work per analyst across a 10-person VM team (~150 hours/week total), removing a manual burden the team cited as a driver of analyst turnover.
- Built Apex and Flow automation generating single-page Visualforce PDF notifications from case data, auto-attaching them, and emailing formatted CVE details to affected agencies.
- Developed a parent/child case pipeline splitting master vulnerability CSVs into agency-scoped files, attaching each to its child case on parent approval, and dispatching remediation notices to selected recipients.

Journal Editorial Management System — React, Jest, Flask API *Jan 2025 – May 2025*

- Built dashboard for collaborative editorial platform: fetched each manuscript's state-valid actions from backend workflow API, filtered by the viewer's editor/author/referee role, and dispatched transitions over an Axios client with inline error handling.
- Implemented the login flow and landing page, with Jest and React Testing Library component tests, shipped through a branch-and-merge workflow to a deployed Heroku app.

EDUCATION

New York University **New York, NY**

B.S. in Computer Science, Minors in Cybersecurity and Mathematics *May 2025*

SKILLS

Languages: Apex, Python, Java, JavaScript, C#, C/C++, SQL, SOQL, Solidity, HTML/CSS

Salesforce: Batch & Queueable Apex, Apex REST, Flow, Platform Events, Visualforce, Named Credentials, OAuth 2.0

Frameworks & Tools: React, Jest, Flask, Git/GitHub, Heroku, Forge (Foundry), Microsoft Excel
